

OPTIMIZED INVENTORY MANAGEMENT WITH AMAZON WEB SERVICES

THE CHALLENGE:

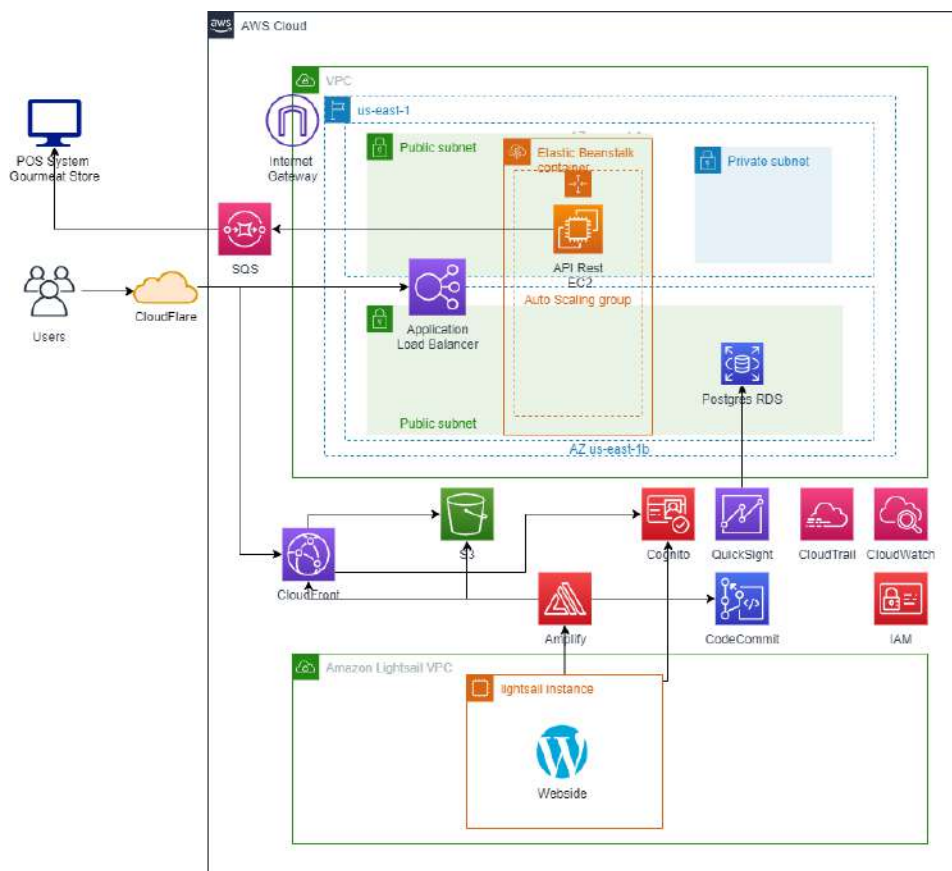

Gourmeat is a premium meat boutique with stores in Uruguay and Miami. They offer a unique in store and online experience when shopping and consuming meat, with a selection of 100% grass fed beef, with no antibiotics and no hormones, carefully selected and sourced from the best lands in South America. Gourmeat uses a Point-of-Sale application hosted on-prem, to manage sales, inventory and customer relations (CRM) for each retail store. Their online store is hosted on a very popular e-commerce platform, and inventory on their warehouse is managed by a combination of manual reports from different vendors. None of these systems were integrated, which presented major challenges to track inventory and sales.

THE SOLUTION:

Nub8 designed and implemented a solution to centrally manage Gourmeat's store and warehouse inventories through a web application using Amazon Web Services (AWS).

The solution is based on a microservices architecture, with a single responsibility, allowing scalability and adaptability over time.

Architecture

Gourmeat is a premium meat boutique with stores in Uruguay and Miami.

Gourmeat offers a unique in store and online experience when shopping and consuming meat, with a selection of 100% grass fed beef, with no antibiotics and no hormones, carefully selected and source from the best lands in South America.

SERVICES INVOLVED:

- Lightsail
- AWS Elastic BeanStalk
- AWS EC2
- Amazon Quicksight
- Elastic Load Balancing
- AWS WAF
- Amazon SQS
- Amazon RDS

THE BENEFITS:

- Centralized inventory of store and warehouse stock.
- Web access to the application.
- Inventory synchronization.
- Permanent data interchange between the warehouse and the store.
- Easy aggregation of new points of sale.
- Security and integrity of Gourmeat's information.
- Faster decision making with advanced sales and inventory reporting and analysis using QuickSight.
